Hornsund

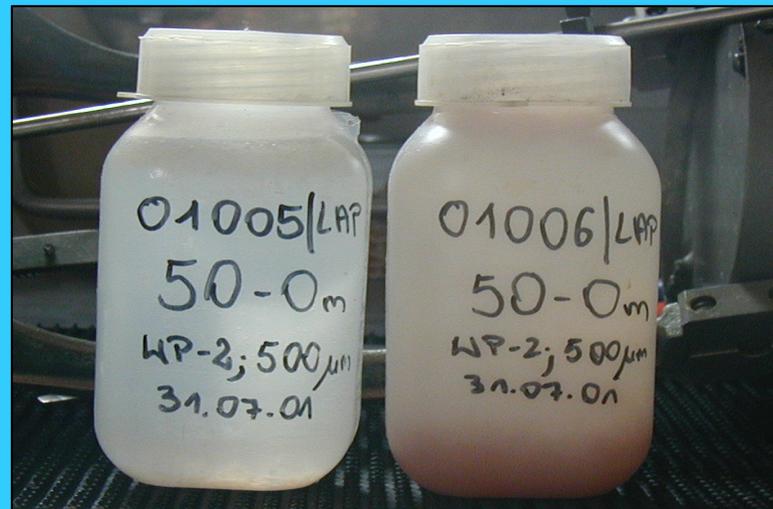

Kongsfjorden

○ LARGE SEABIRDS COLONIES  
 — REGULAR OCCURENCE OF SEALS

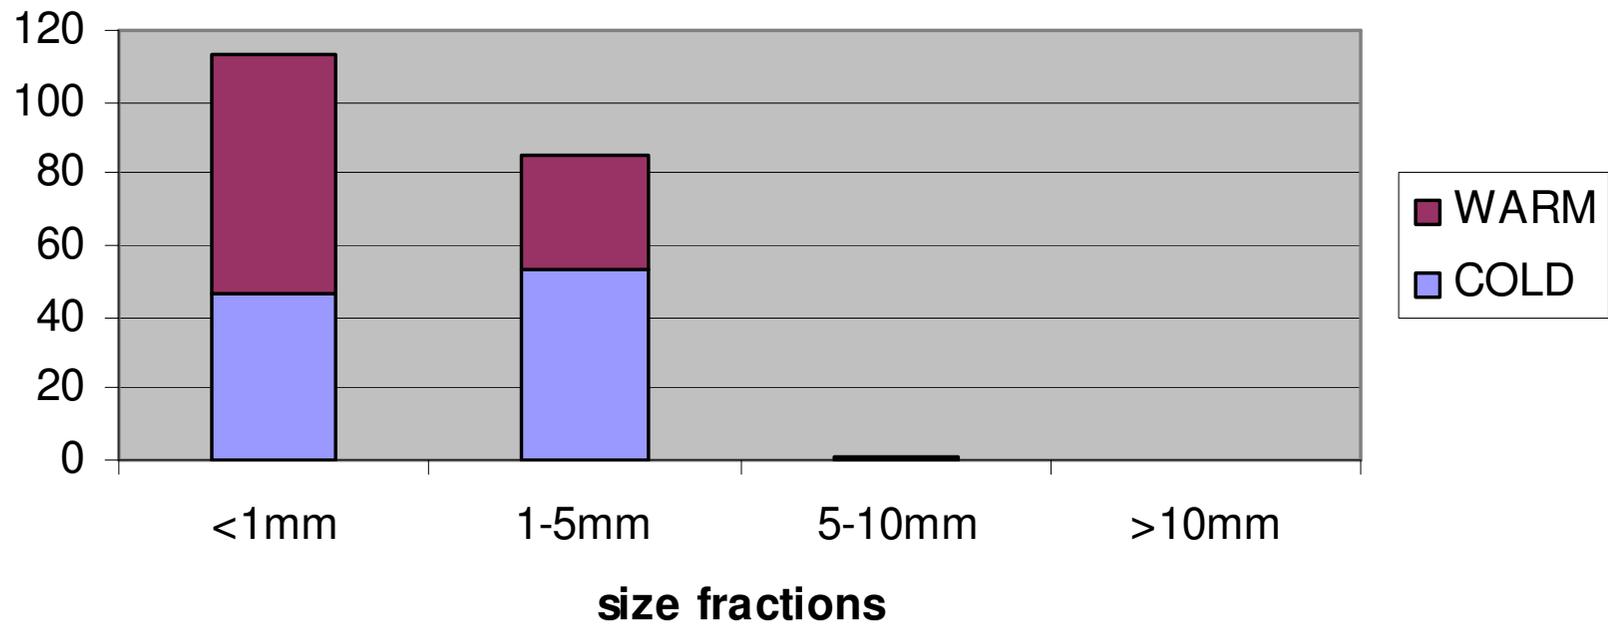

# Large (eidible) zooplankters in Arctic and Atlantic waters off Hornsund

**2.2 kJ/m<sup>3</sup>**

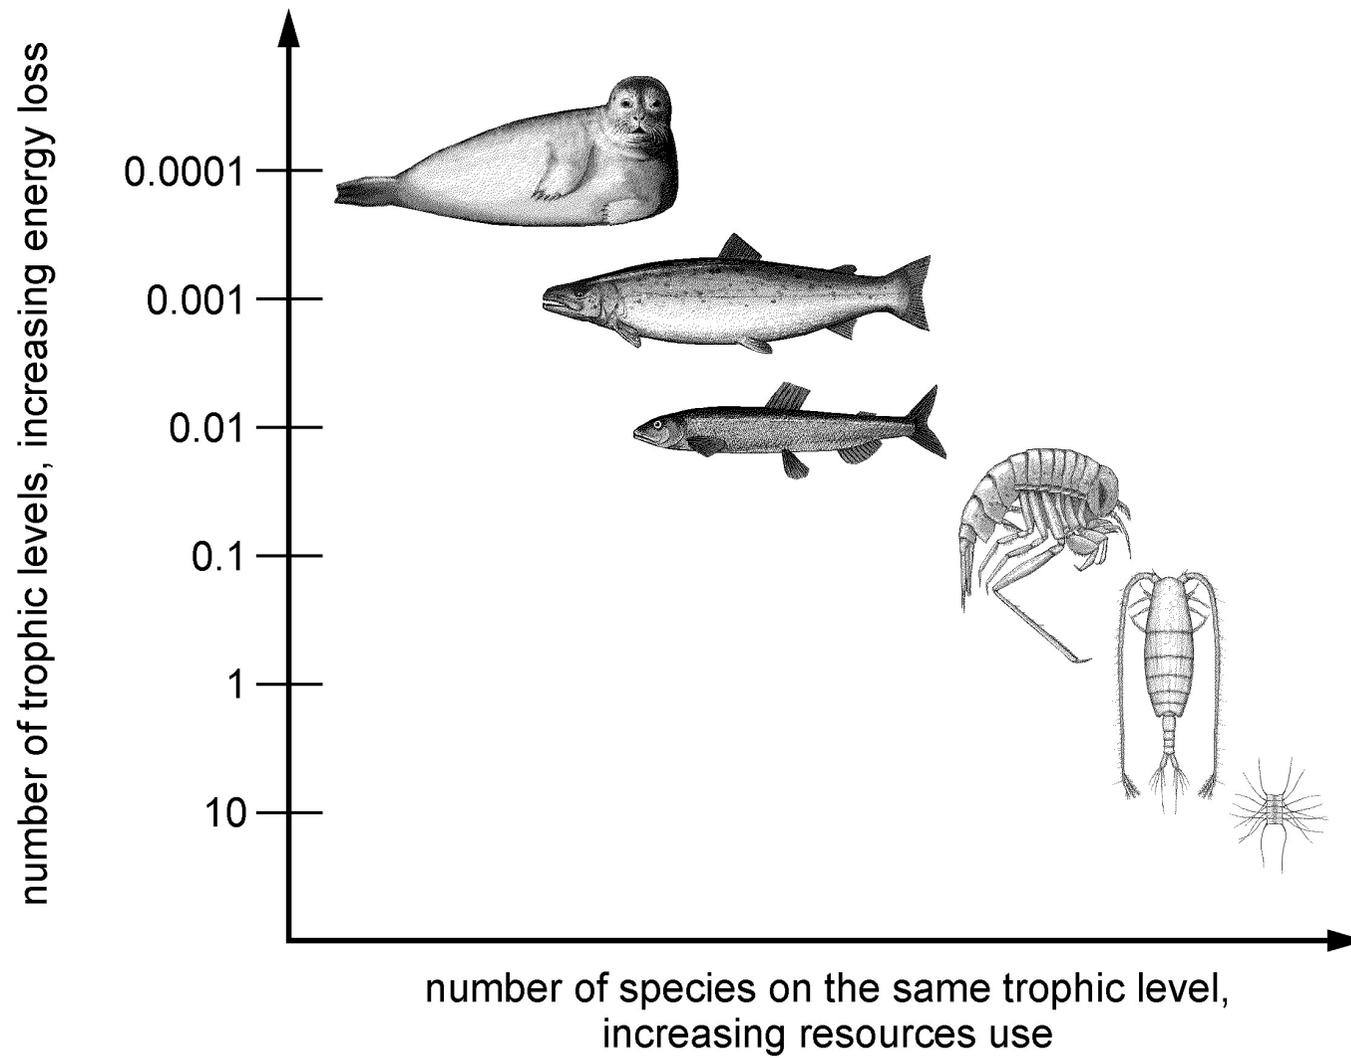

**6.9 kJ/m<sup>3</sup>**

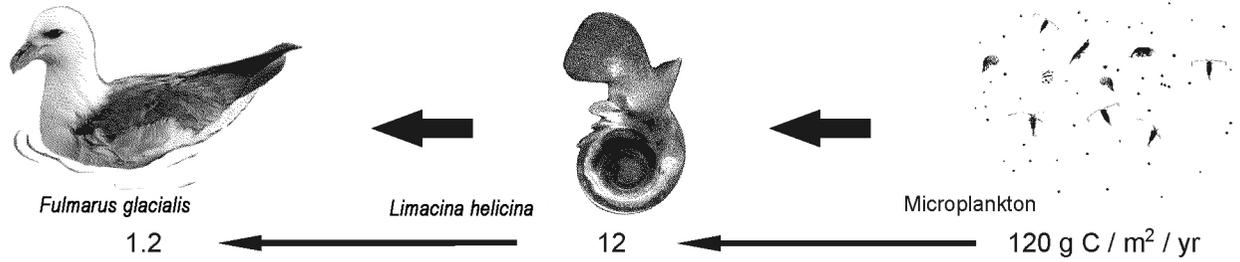

### Percentage abundance of zooplankton in size classes

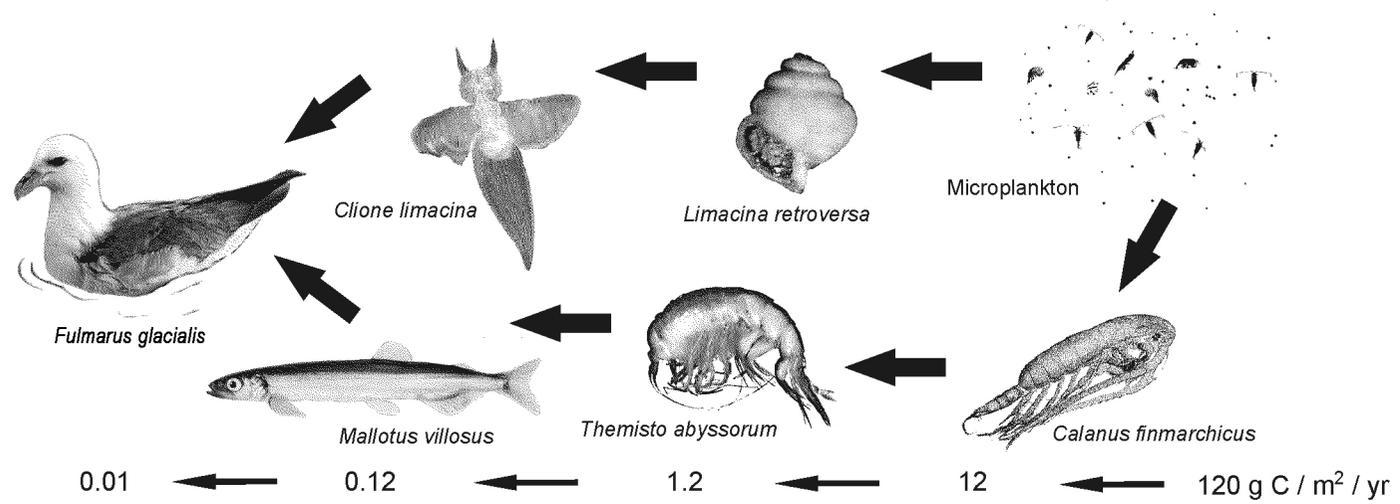

What we expect

## ARCTIC

## SUB-ARCTIC

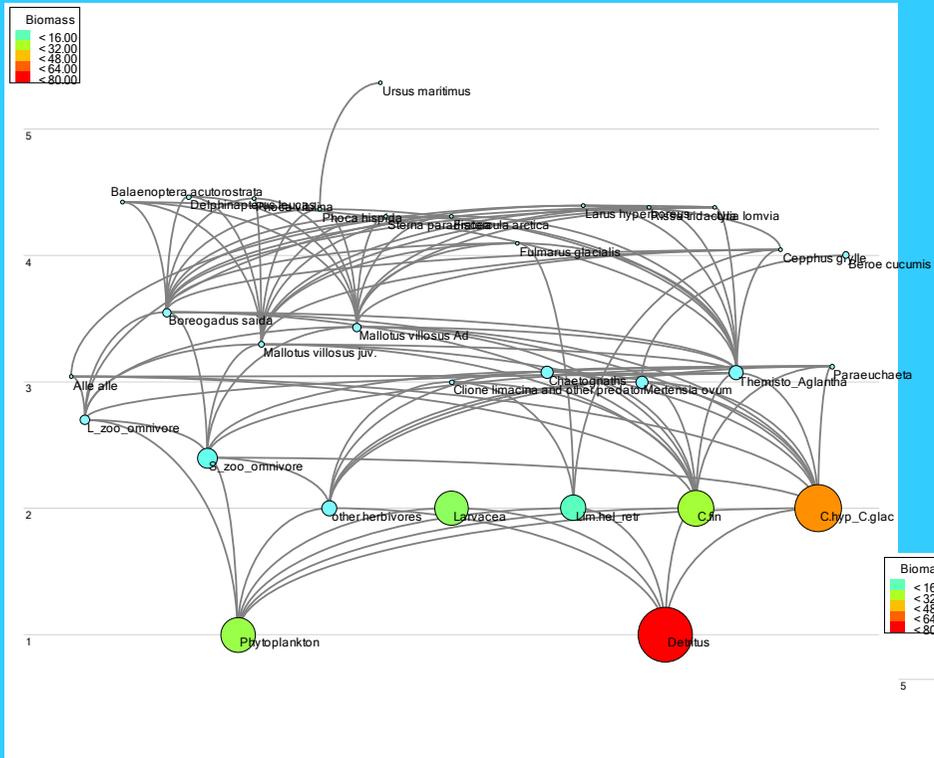

# What we have modelled

# ECOPATH - ECOSIM

- Christensen et al. 2004
- Considering Production, Biomass, Diet, Consumption
- Up to 33 compartments (analysed groups)

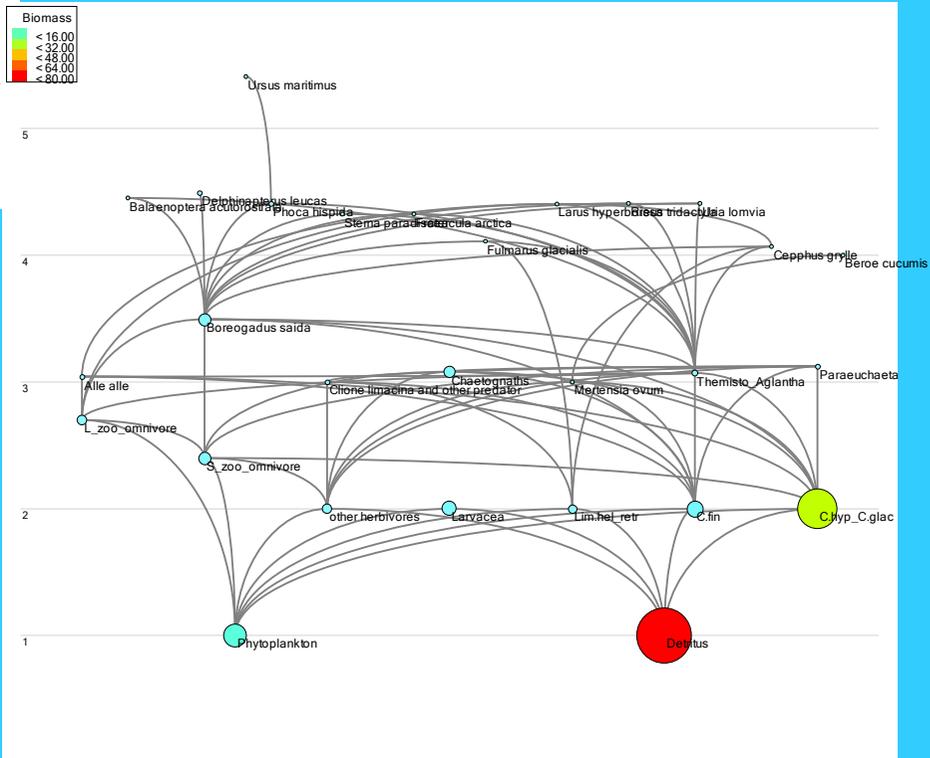

<b>main group</b>	<b>species accounted</b>
top predators	2
whales and seals	4
seabirds	6
pelagic fish	4
planktonic small predators	6
planktonic herbivores	4
planktonic omnivores	2
phytoplankton	4
detritus	1

Together 33 groups in the model

# Kongsfjorden:

- More species
- More complex network
- Longer distance between trophic levels
- Less advection required
- Less energy to top predators ?
- Higher stability ?

# Hornsund:

- Less species
- Simpler network
- Shorter distance between trophic levels
- More advection required
- More energy to top predators ?
- Lower stability ?

<b>Parameter</b>	<b>KGF</b>	<b>H</b>	<b>Units</b>	
<b>Total system throughput</b>	<b>3960</b>	<b>9268</b>	t/km <sup>2</sup> /ti me	indicates the size of the system flow
Calculated total net primary production	1232	4320	t/km <sup>2</sup> /ti me	
<b>Total primary production/total respiration</b>	<b>2</b>	<b>13</b>	t/km <sup>2</sup> /ti me	closer to 1 indicates maturity
Total primary production/total biomass	6	54	t/km <sup>2</sup> /ti me	lower the rate in more mature system
Total biomass (excluding detritus)	193	80	t/km <sup>2</sup>	
<b>Proportion of total flow originating from detritus</b>	<b>0,29</b>	<b>0,46</b>		higher in stressed, non matured systems
Transfer efficiencies between TL	11,1	12,4		mean for coastal water between 10 and 15%
<b>Finn's cycling index (% of total throughput cycled)</b>	<b>5,05</b>	<b>0,63</b>		indicates system integrity
Finn's mean path length	2,97	2,12	none	

# What remains to be done

- Diet studies on lower trophic levels
- Share of the microbial loop
- More species to be included in the model

# Far reaching conclusions

- In terms of energy flow the warming of the Arctic means the maturation of the system
- Warmed up coastal Arctic waters may easily be dominated by small (down to microbial loop) food web compartments
- Lack of ice need not to be beneficial to fishery...
