

# Extensive sampling of *Saccharomyces cerevisiae* in Taiwan reveals ecology and evolution of pre-domesticated lineages

Isheng Jason Tsai

Biodiversity Research Center, Academia Sinica, Taiwan

2022 PAS-AS meeting

# Research organisms: Fungi and nematodes

## Fungi

*Saccharomyces cerevisiae*

*Fusarium solani*

*Acrodontium crateriforme*

bioluminescent *Mycena*

## Microbiome and mycobiomes

## Nematodes

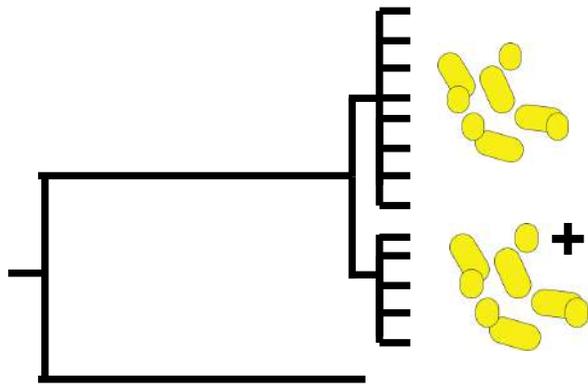

*Bursaphelenchus xylophilus*

*Aphelenchoides besseyi*

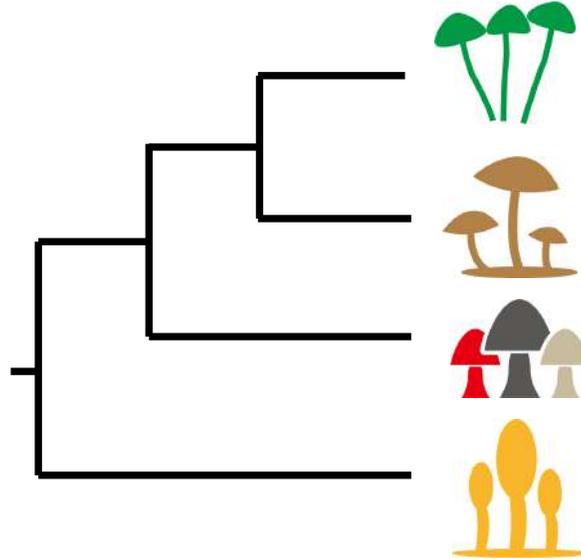

Marine free-living nematodes

# Approaches

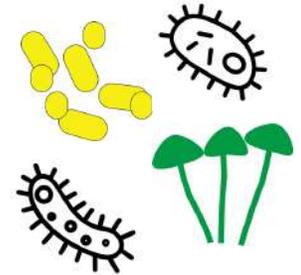

Population genomics

Comparative genomics/transcriptomics

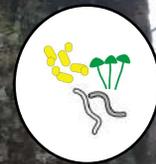

Metagenomics/  
metatranscriptomics

—  
million years ago

Can we understand the whole picture (who, where, how species live, interact and evolve)?

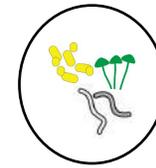

Ring-cupped Oak forest (~2300m, Nantou County, Taiwan)

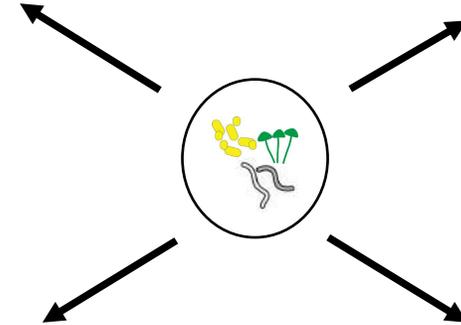

tiny fraction!

# Unknown domain

Understanding of model organisms /  
disease orientated species

Strategy: study the ecology and evolution of siblings to model organisms

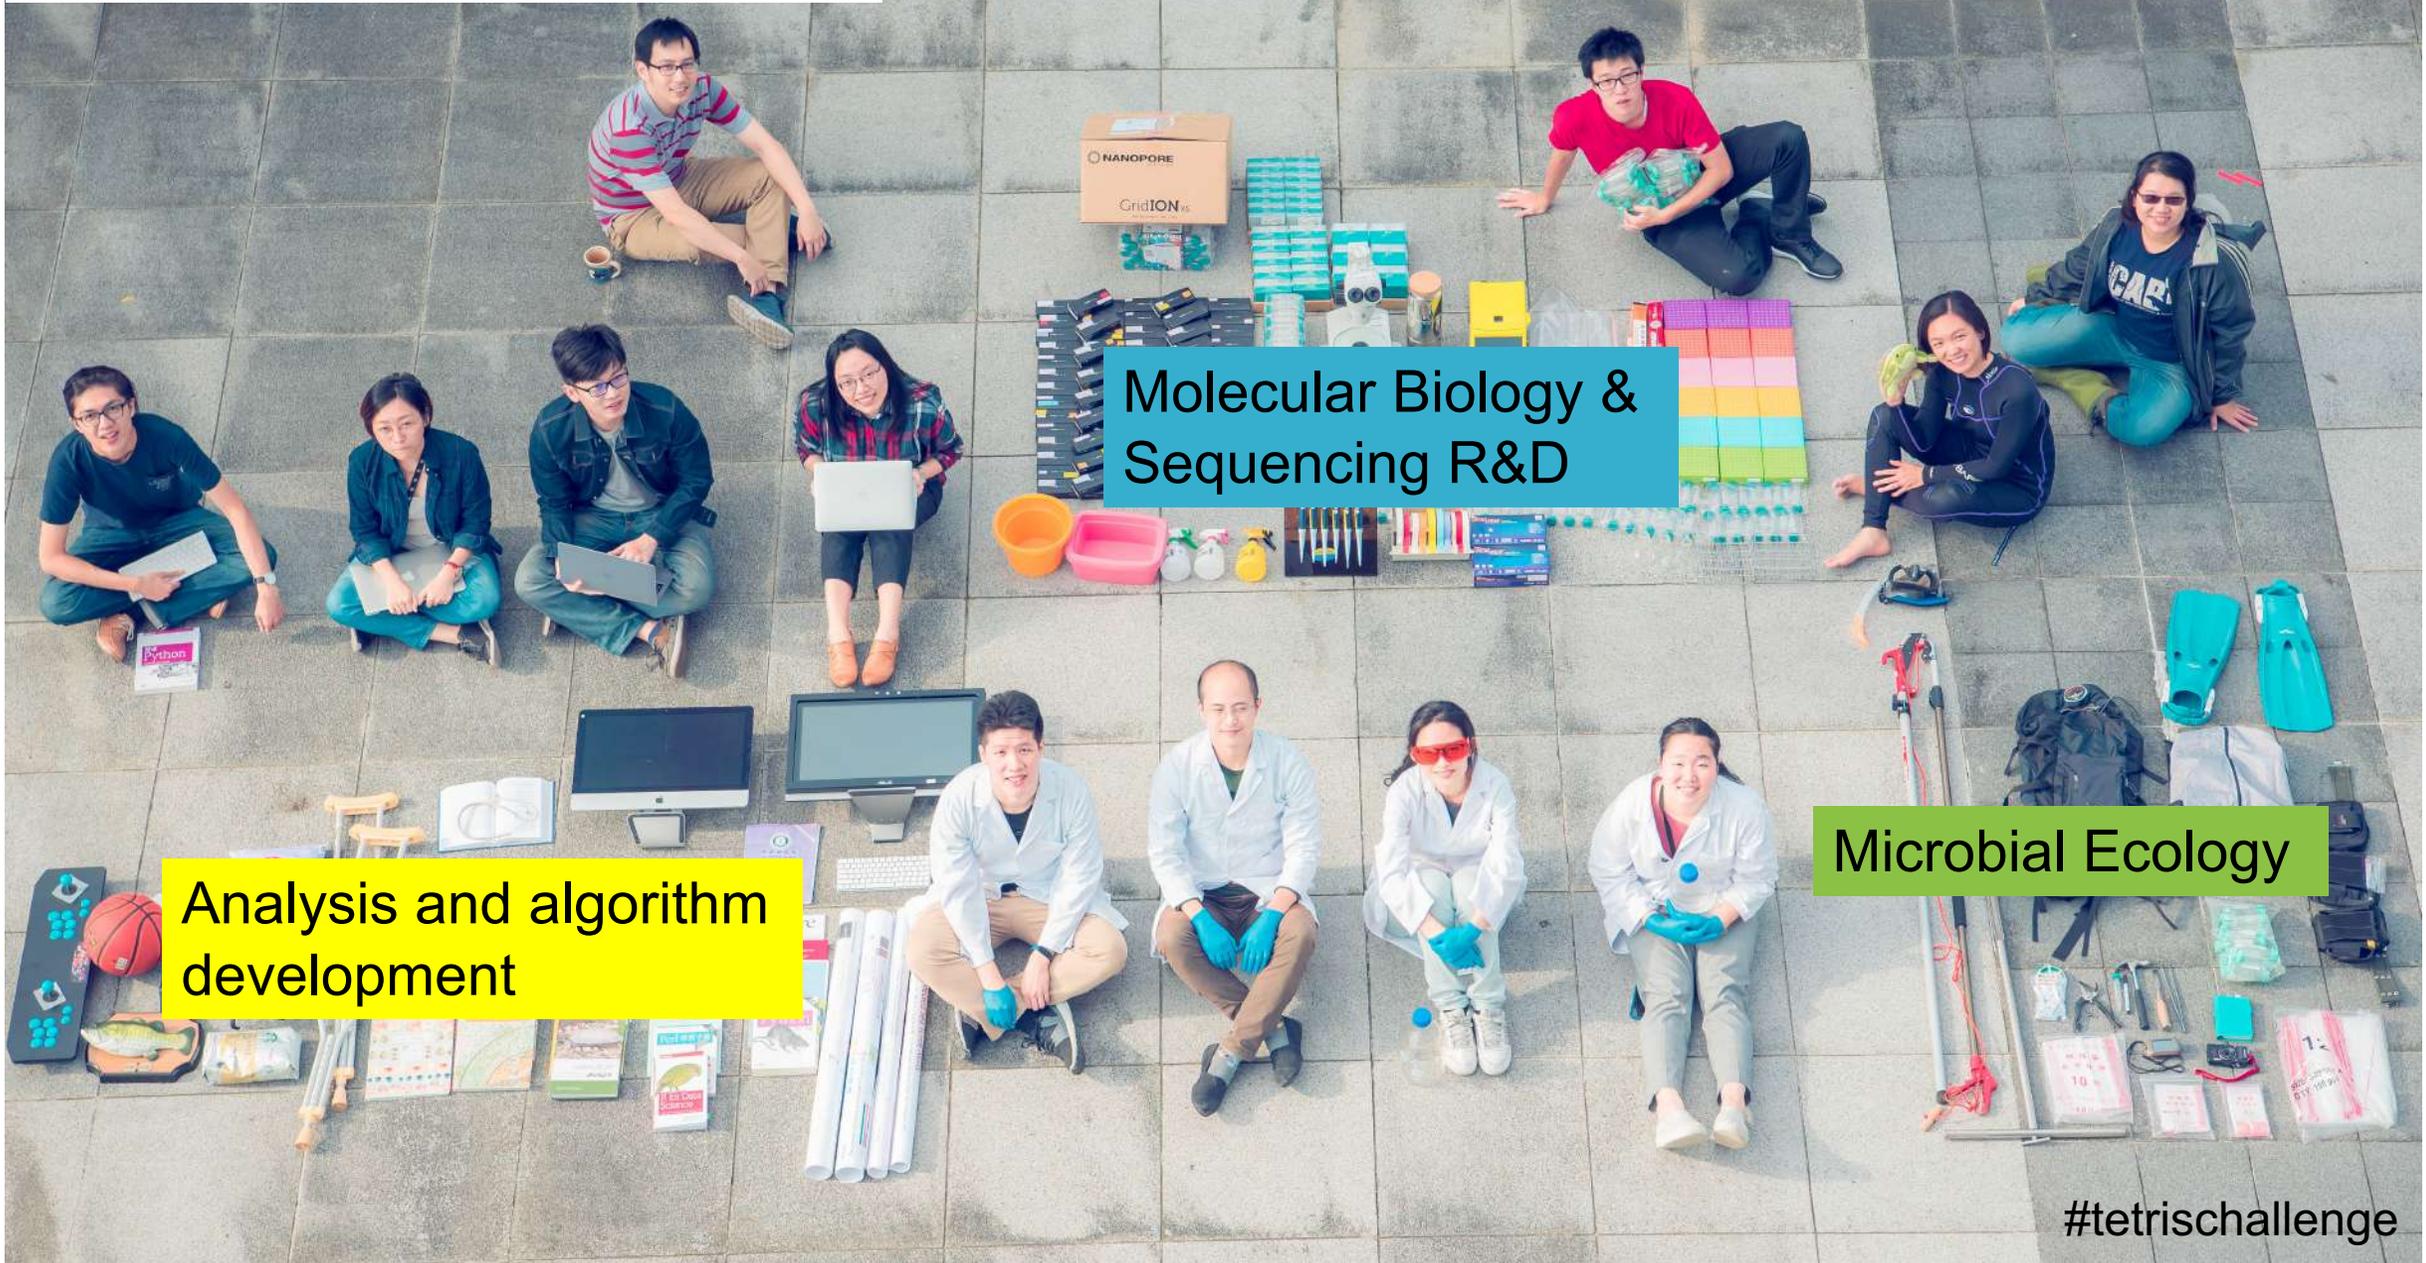

Extensive traits and tools

Research in model organism → Knowledge

Natural environment + Wild collections

Establish new models in ecology;  
Formulate questions from nature

# Lab setup

Molecular Biology & Sequencing R&D

Microbial Ecology

Analysis and algorithm development

#tetrishallenge

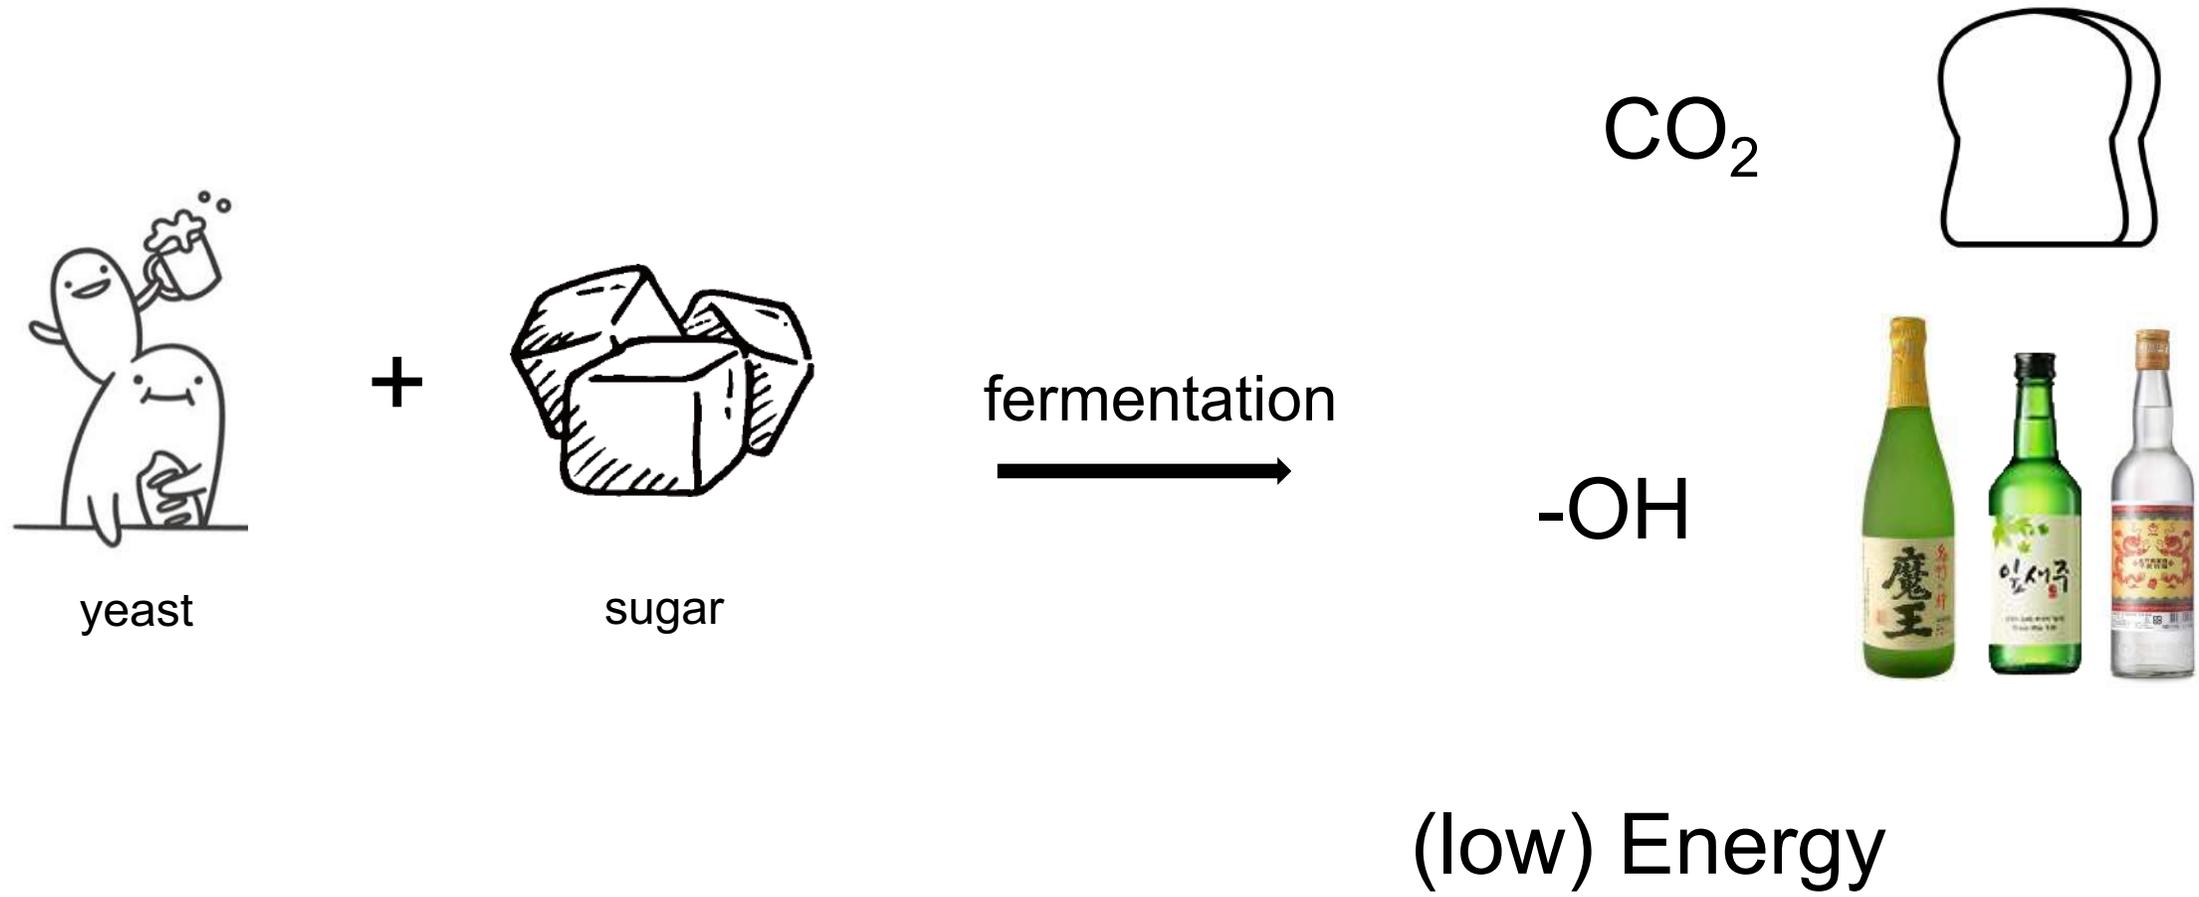

Deep sampling of ancestral genetic diversity reveals *Saccharomyces cerevisiae* pre-domestication life histories

Tracy Lee

# *S. cerevisiae* as arguably one of the most domesticated (researched) species for its fermentation ability

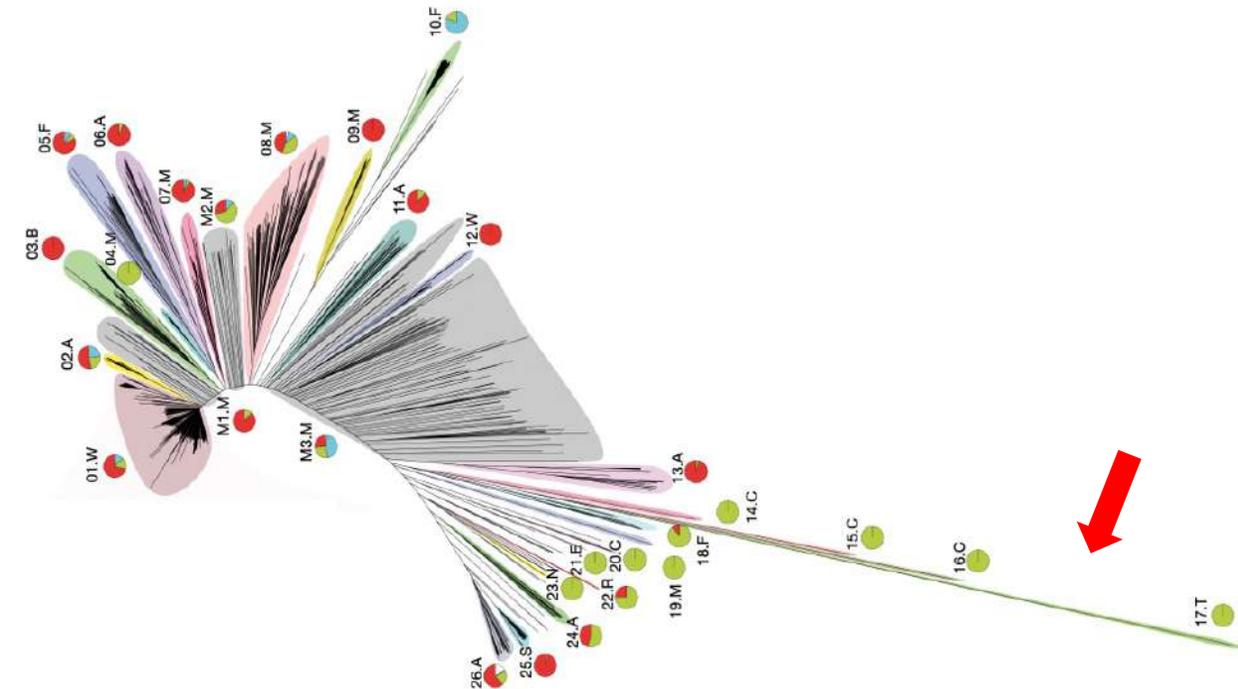

# Outstanding questions

1. geographic origin of *S. cerevisiae*

# A far east origin of *S. cerevisiae*

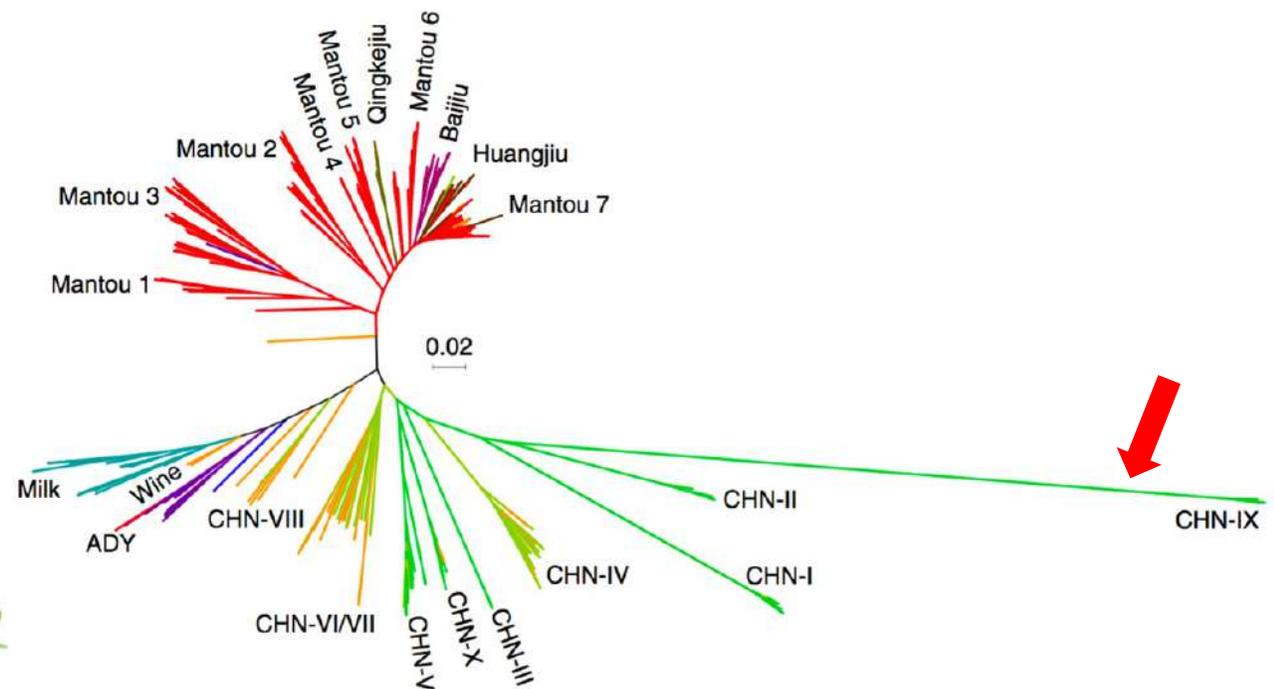

1,011 isolates

“The **Taiwanese wild lineage** represents the most divergent population that has yet been described”

Peter *et al.*, (2018) Nature

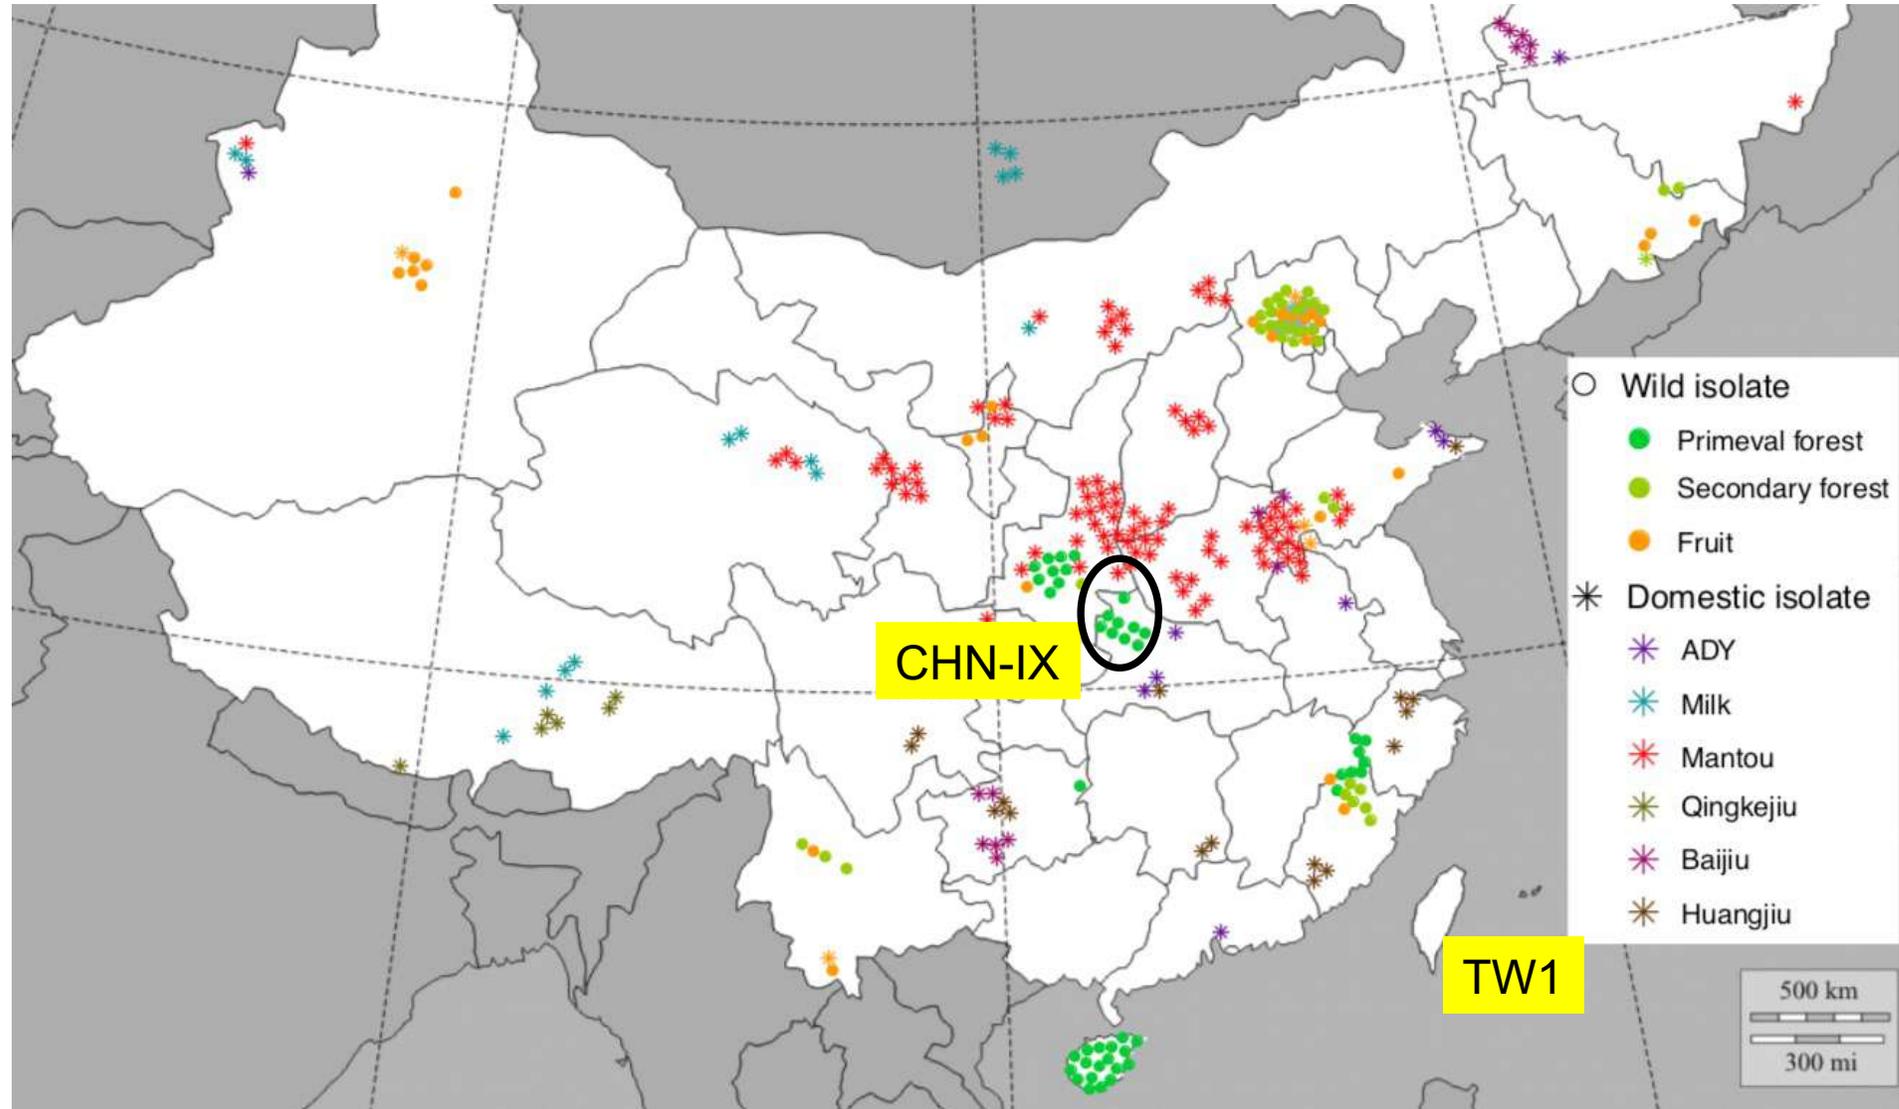

266 isolates

“CHN-IX contains isolates from a subtropical **primeval forest located in central China** and represents the most basal lineage of *S. cerevisiae*”

Duan *et al.*, (2018) Nature Communications

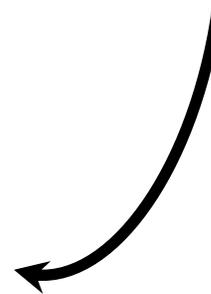

# *S. cerevisiae* lineages displaying a disjunct distribution

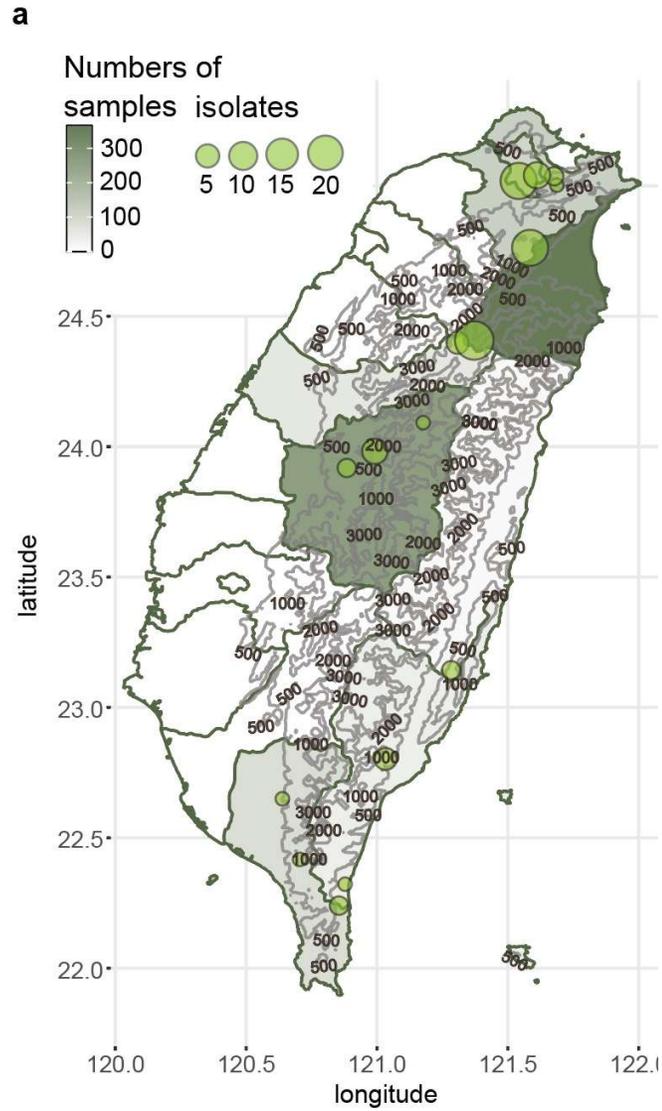

# Outstanding questions

1. geographic origin of *S. cerevisiae*
2. ecology of *S. cerevisiae* in nature
3. biogeography of *S. cerevisiae*

✓ East Asia

# Sampling and isolating *Saccharomyces* since 2016

Flowers of Fagaceae

National park paths

*Quercus*

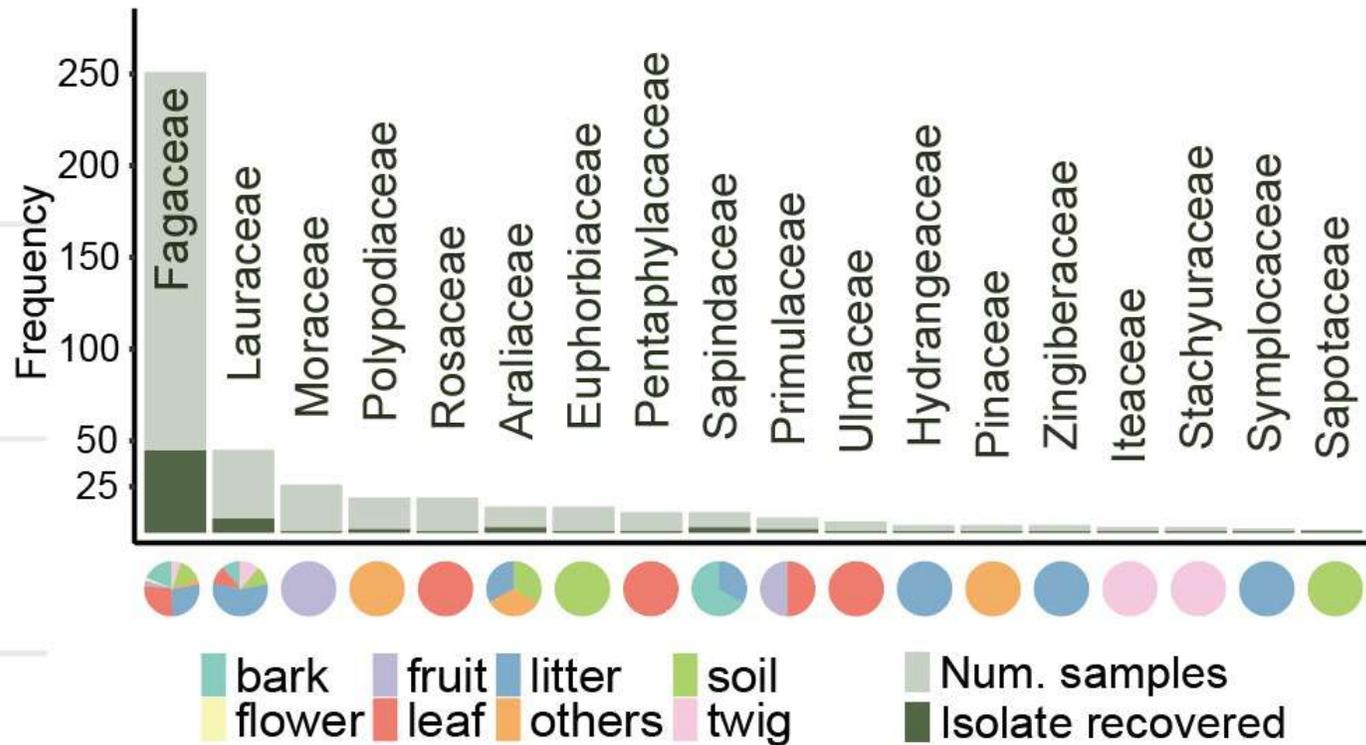

公路旁

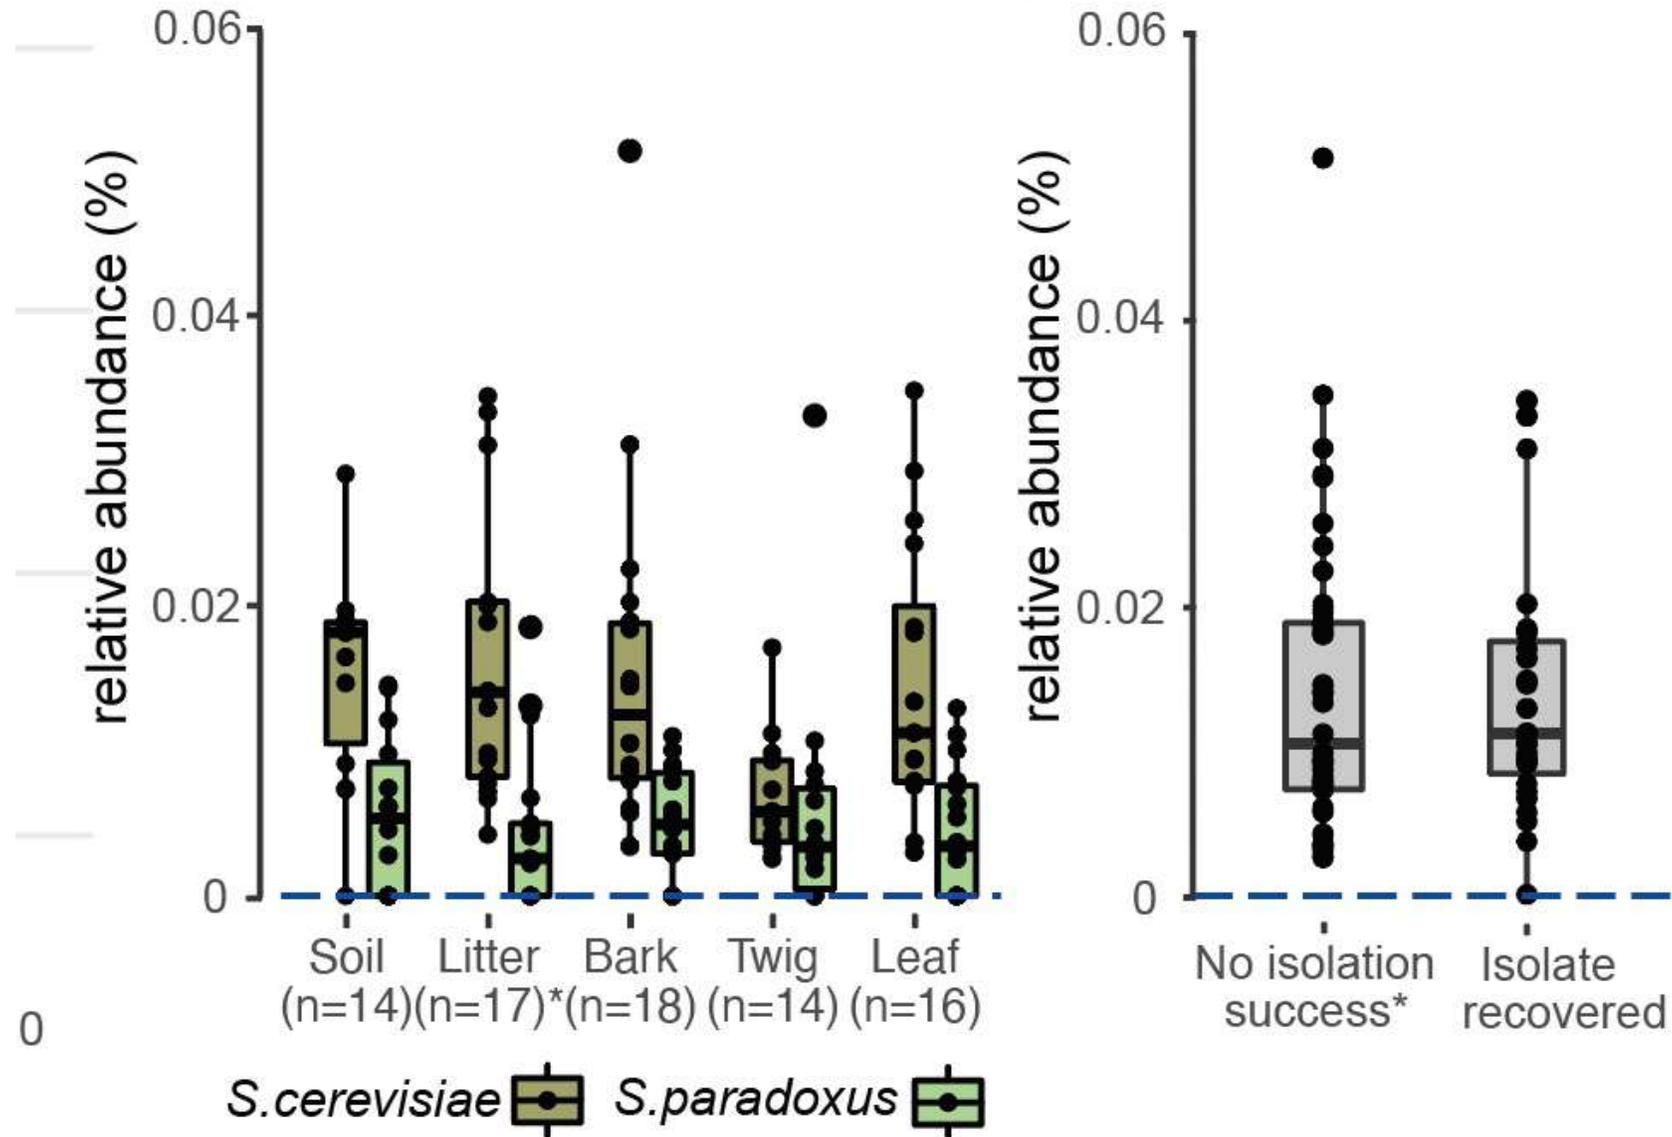

Amenity trees

# Deep sampling and isolation of *S. cerevisiae* in Taiwan.

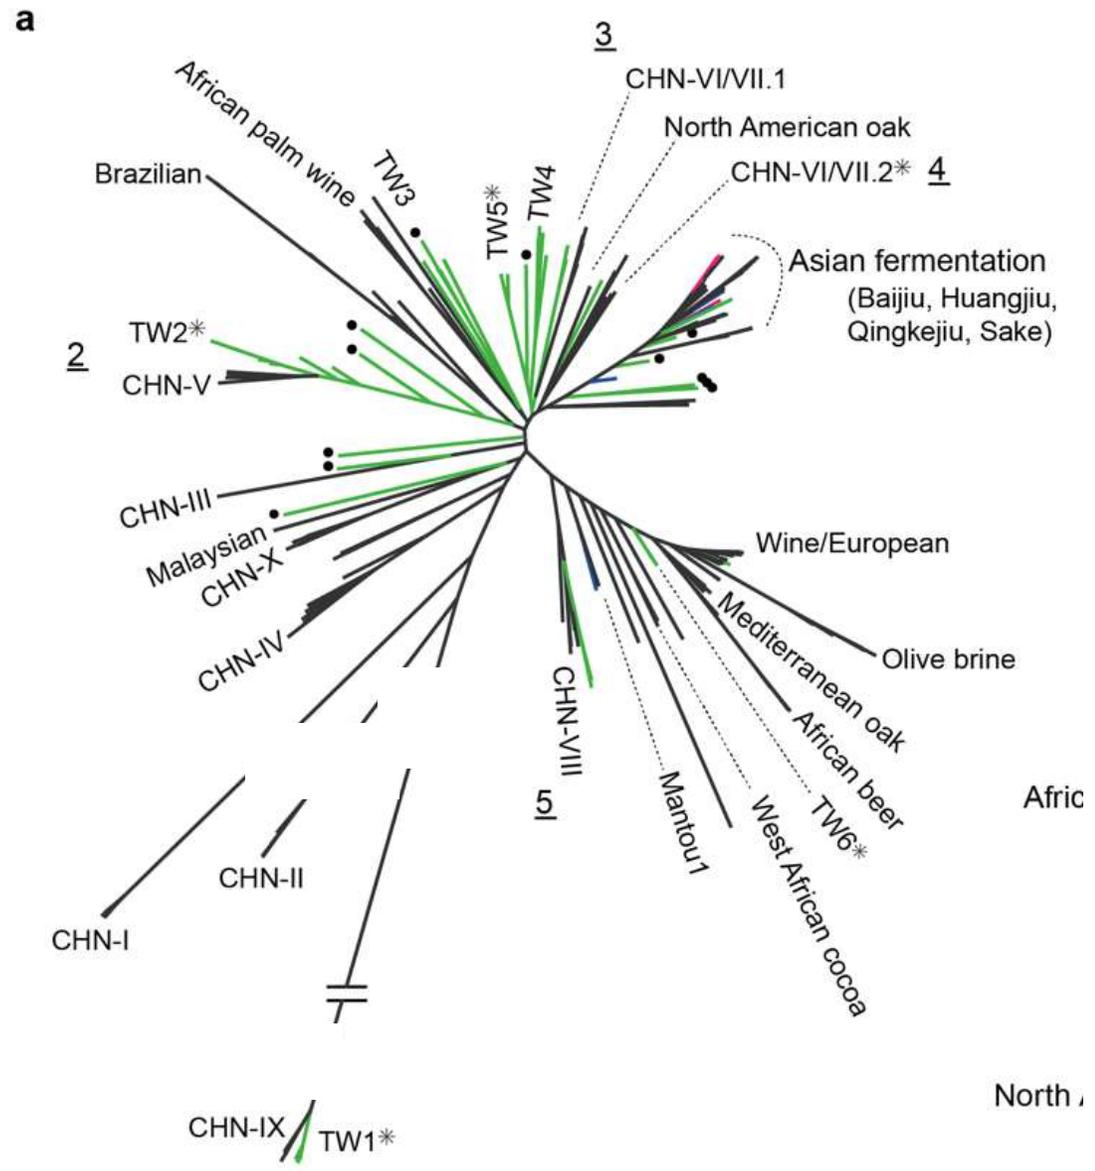

Isolation rates of *S. cerevisiae* per sample and per tree host was **1.9** and **10.8%**, respectively

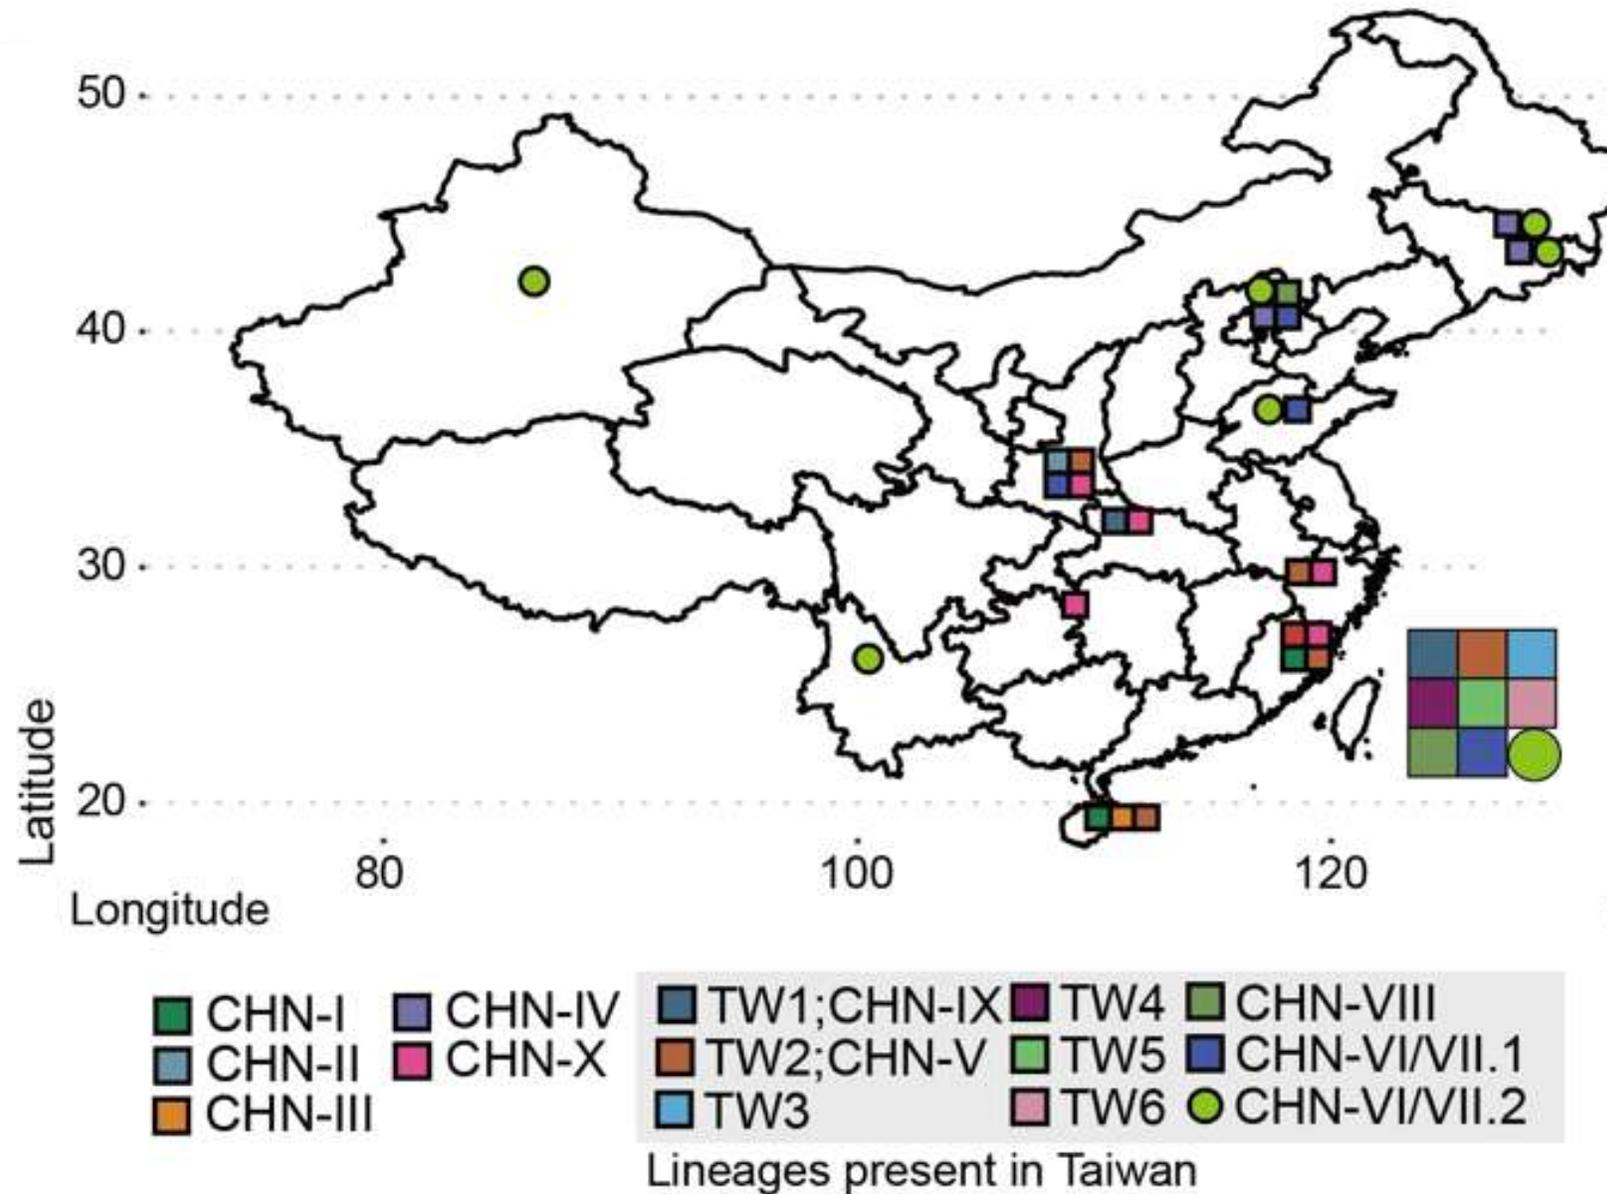

# Deep sampling and isolation of *S. cerevisiae* in Taiwan.

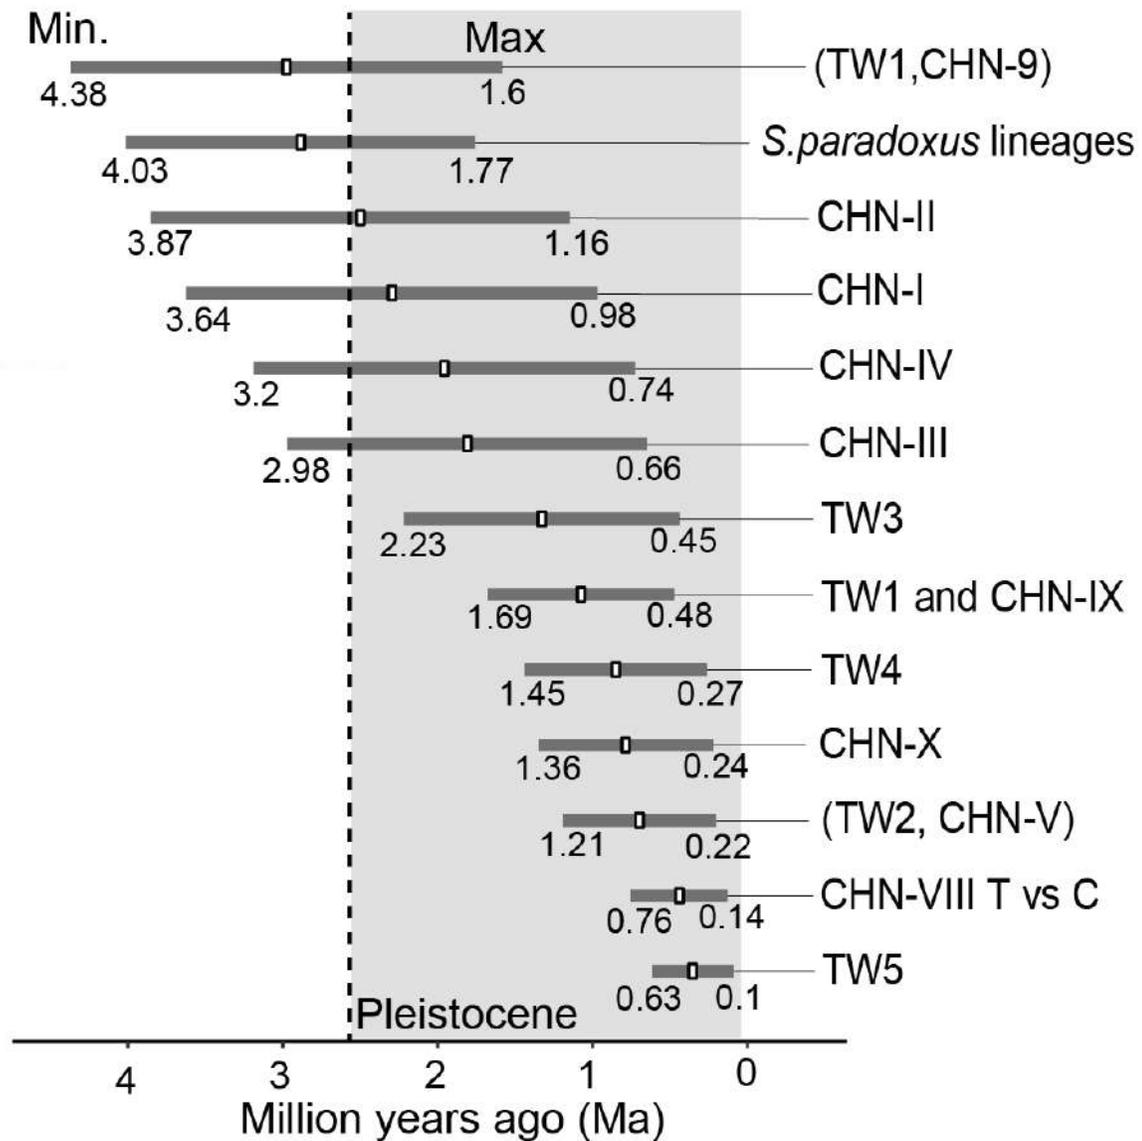

# A maximum likelihood phylogeny based on 808,864 SNPs segregating in 340 isolates

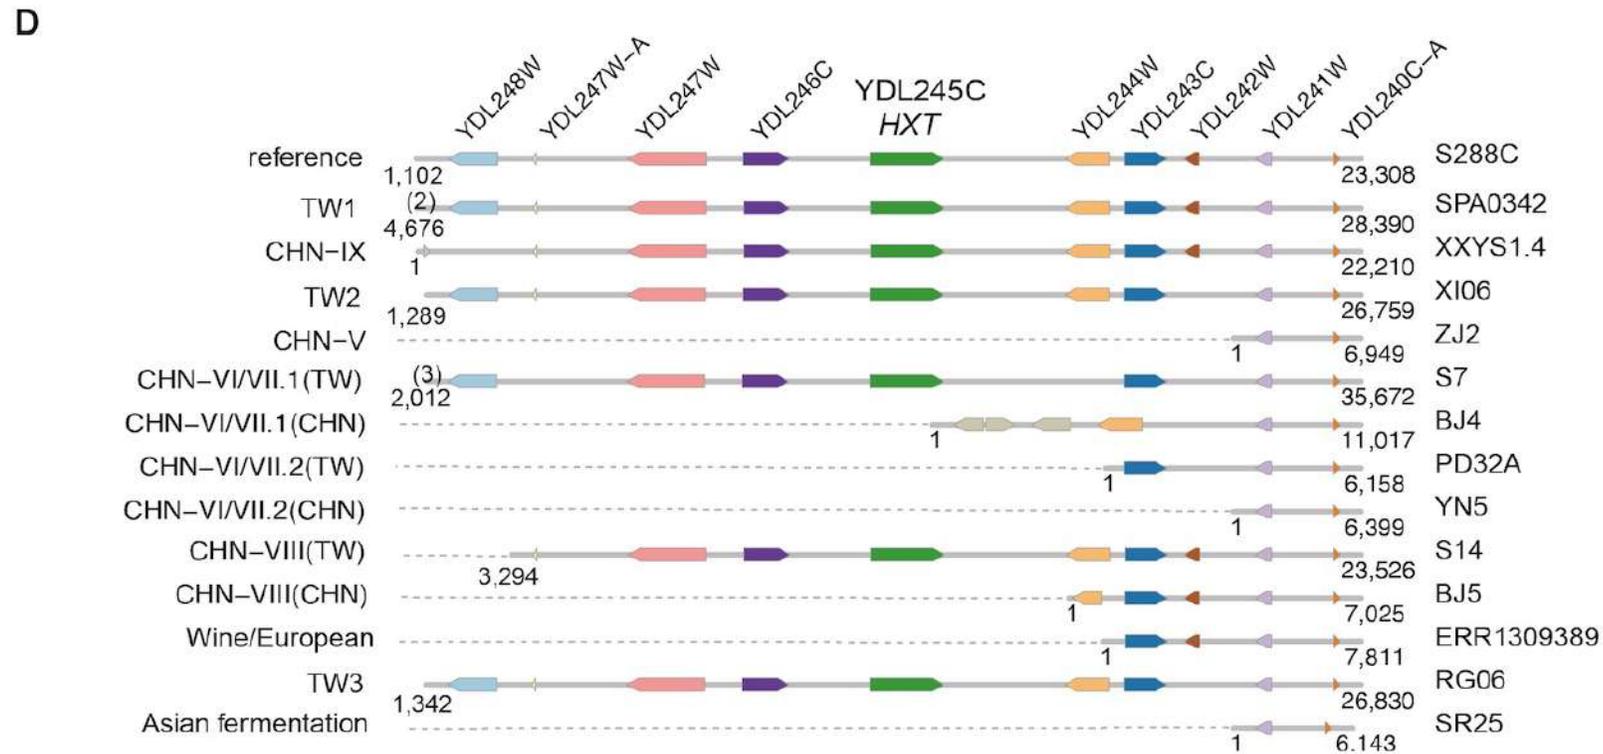

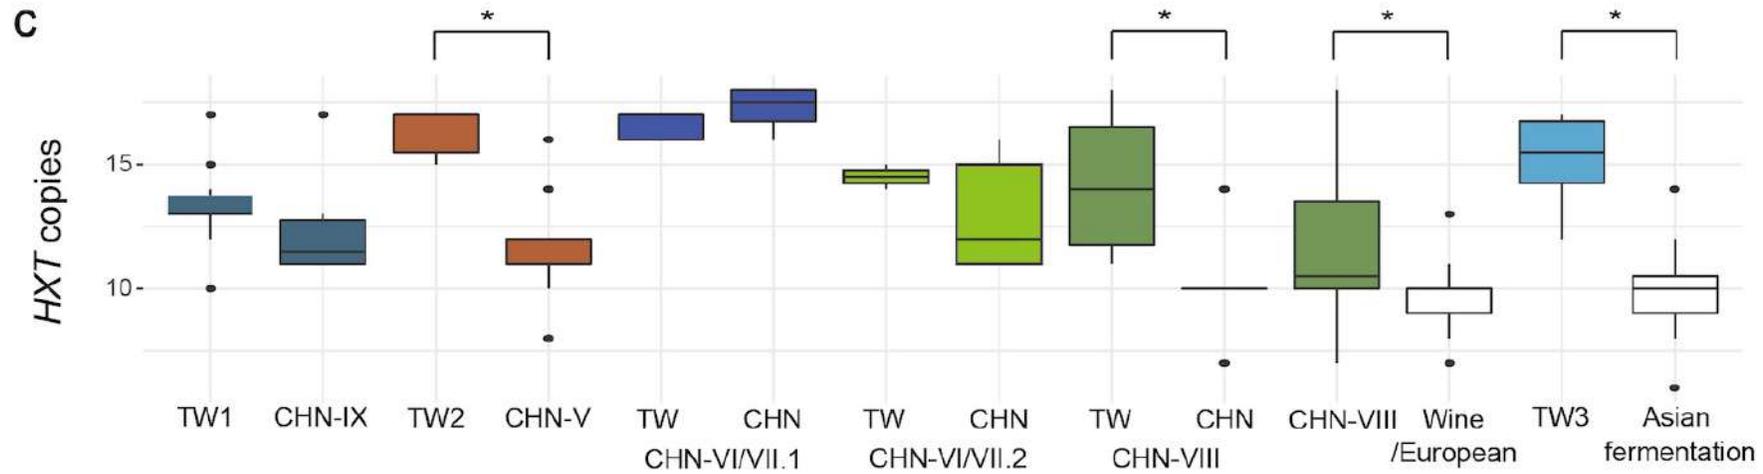

# Biogeography of *S. cerevisiae*

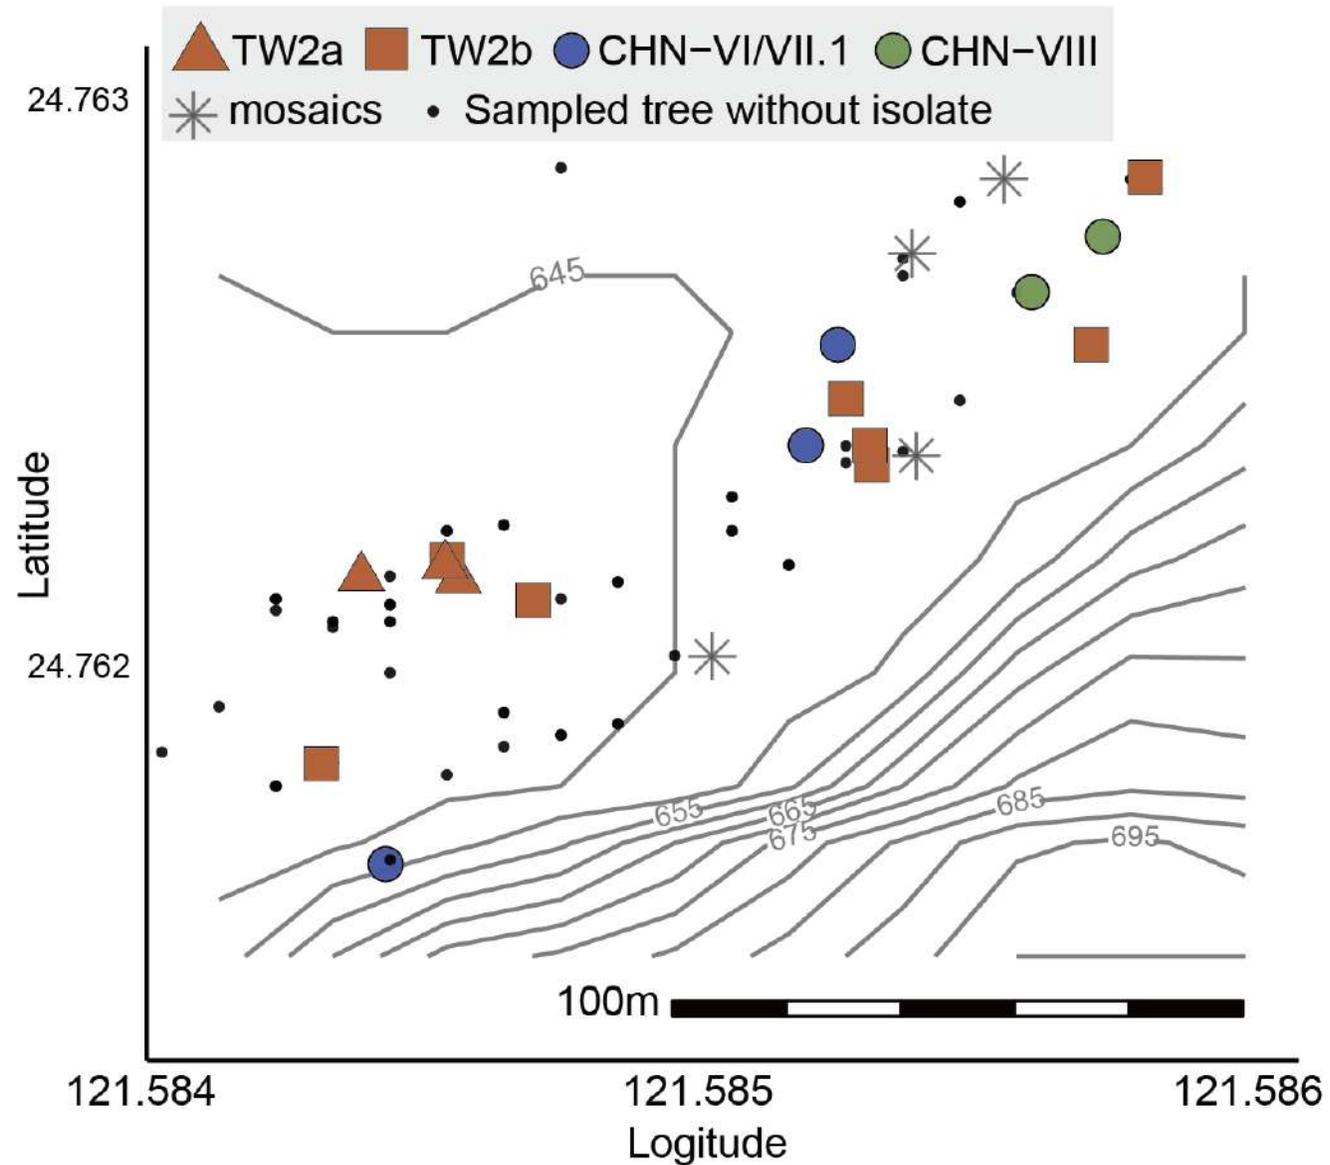

# CHN/Taiwan isolates diverged during the Pleistocene

# CHN/Taiwan undergo independent evolutionary scenarios

# Patterns of genetic variations and geographical distribution in *S. cerevisiae*

# Summary

Extensive traits and tools

Research in model organism → Knowledge

Natural environment + Wild collections

Establish *S. cerevisiae* as the new model in microbial ecology; Formulate questions from nature

# Acknowledgement

## Deep sampling of ancestral genetic diversity reveals *Saccharomyces cerevisiae* pre-domestication life histories
