# Cruise report R/V "Oceania", Arex 2005 

Ship
R/V "Oceania"

Criuse Arex2005

Dates 8.06.2005-18.07.2005
Port Calls Gdansk (Poland) - Longyearbyen (Spitsbergen)
Number of Scientist 11

Chief Scientist dr Waldemar Walczowski

Principal Project ASOF-N, WP1
Research Area Greenland Sea

# WP1. Atlantic Water pathways in the Greenland Sea 

Waldemar Walczowski, Jan Piechura, Robert Osinski, Piotr Wieczorek, Ilona Goszczko (IO PAS)

## 1. Introduction

Institute of Oceanology Polish Academy of Sciences has been doing oceanographic research in the Norwegian, Greenland and Barents Seas since 1987. During summer cruises hydrographic data are collected, some at the same permanent stations and transects. Since 1993 the VM ADCP data has been installed, since 2003 the lowered ADCP measurements have been introduced.

Measurements were conducted within the Atlantic Domain of the Norwegian and Greenland Sea, between Barents Sea slope and underwater ridges system - Mohns Ridge and Knipovich Ridge. Due to convergence of the isobaths in the northern part, AW domain forms wedge, wide in southern part and narrow in the northern end. Specific bottom topography meaningfully influences the currents pattern and structure. Coverage in the southern part of investigated area is spare in comparison to the northern one. This causes less accurate horizontal distribution of properties in the region south of the Bear Island. Our main effort was concentrated in the northern part of Atlantic Domain where processes controlling the AW inflow into Arctic Ocean through the Fram Strait and the westward recirculation take place.

## 2. Observations in 2005

AREX2005 cruise of the R/V Oceania was performed in the period of June 082005 August 18 2005. 200 CTD (conductivity, temperature, depth) profiles along 13 sections were done (Fig. 1, Tab.1). Sections were situated perpendicular to the supposed direction of the Atlantic Water flow. Some profiles were done near ice pack to observe the water conditions and intrusions.

For CTD measurements the Seabird SBE9/11plus probe was used. The probe was serviced before the cruise. Temperature and conductivity sensors were calibrated by the Sea-Bird Electronics service. Water samples collected by means of the rosette water sampler SBE32 were analysed at the ship and in IOPAS laboratory with the Guildline Autosal 8400A. Water temperature was checked by electronic reversing thermometers.

Measurements of currents were performed by means of lowered Acoustic Doppler Current Profiler (LADCP). The self-recording 300 kHz RDI device was used to profile entire water column during the standard CTD casts.
During the whole cruise continuous currents measurements by the shipmounted ADCP, RDI 150 kHz were conducted.

Fig. 1. Grid of CTD stations performed in summer 2005. Most of all sections are parallel or near parallel. They cut across West Spitsbergen Current. Sections Gimsøy, NearX, W and North close WSC region from south and north. Meridional section V and east part of section O provide data from Storfjordrenna and Byørnøyarenna..

Table 1
CTD stations and some of their main parameters. There are 10 regular sections and some short sections: W, North, Near X. Additionally, there are several stations near ice cover north of Spitsbergen.

## 3. Some preliminary results

Figure 2 presents potential temperature and salinity diagrams for particular sections which were situated across West Spitsbergen Current. Each section includes different types of profiles. Some of them represent shallow region of continental shelf westward of Svalbard. The others show situation on shelf break, continental slope or near ridges. Those different bottom conditions and geographical location determine properties of water masses: potential temperature, salinity and potential density.

The general flow structure cross the sections, obtained from baroclinic calculations, ADCP and LADCP measurements was similar (Fig.3) however baroclinic transports calculated from hydrological data and total transports from LADCP measurements differ a lot.

As in earlier cruises, during 2005 cruise two northward flowing branches of Atlantic Water in the Greenland Sea were observed. The main branch of the West Spitsbergen Current flows along the Barents Sea continental slope and Spitsbergen shelf break. The second, colder and less saline branch continues along the Mohns and Knipovich Ridges as a jet stream of the Arctic Front. Due to the bottom topography, both branches of AW converge west of the southern Spitsbergen coast.

Figure 4 presents the distribution of temperature and baroclinic currents at depth 100 m (calculated for the reference level of 1000 m .) during summer 2005. To reduce effect of non-uniform data spacing, temperature and HD fields were smoothed and filtered. Finally, the picture of general currents pattern was obtained, rather then synoptic snapshot. Like in 2004, westward recirculation of AW was in 2005 limited. Northward transport of AW by branch related to the Spitsbergen slope was relatively high. Two large antycyclonic eddies carried high amount of heat were observed the Arctic Front.

In conclusion the AW temperature in 2005 was very high, even higher than in 2004 (fig 5). Also calculated heat content in the AW layer was higher than in 2004. It concerns the whole domain, also southern part. These data show that during 2006 continuation of high heat inflow into the AO will take place.

Fig. 2. Potential temperature and salinity diagrams with contours of corresponding $\sigma_{\theta}$ for all hydrographical profiles performed on 2005 cruise. Particular plots present data from different sections. Profiles from north of Svalbard are collected on one graph.

VM-ADCP V velocity

Fig. 3. VM-ADCP currents (upper bar), geostrophic baroclinic currents and LADCP measured flows cross the West Spitsbergen Current. Section EB2 along the $78^{\circ} 50^{\prime}$ N. R.V. 'Oceania', June 2005.

Fig. 4 June-July 2005. Smoothed temperature distribution and baroclinic currents at 100 m . Reference level 1000 m .

Fig. 5. Changing of mean temperature at 200 m of section ' $\mathrm{N}^{\prime}\left(76^{\circ} 30^{\prime} \mathrm{N}\right)$ between latitudes $09-12^{\circ} \mathrm{E}$.
